Implementing CloudFront for Caching and Application Security

What is CloudFront?

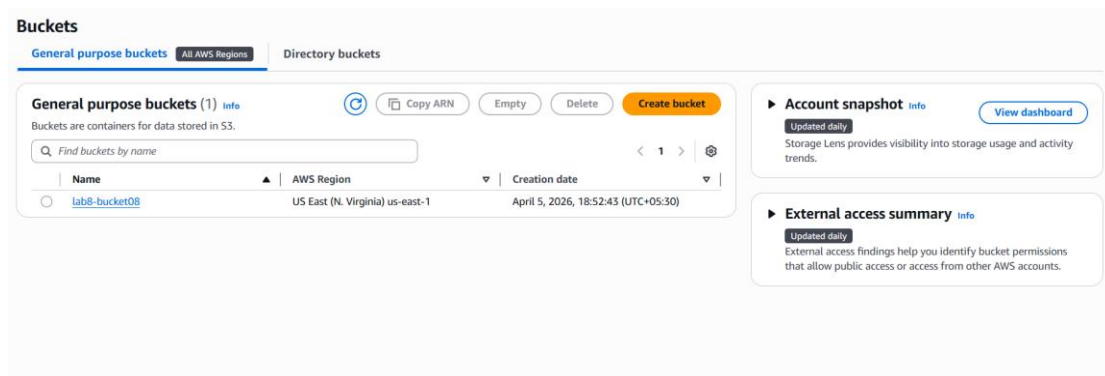

CloudFront is a **Content Delivery Network (CDN)** that:

- Stores cached copies of your content (images, videos, web pages)
- Delivers them from the **nearest edge location**
Result: **Faster loading & reduced server load**

Caching → Stores frequently used data to make apps **faster** and reduce server load

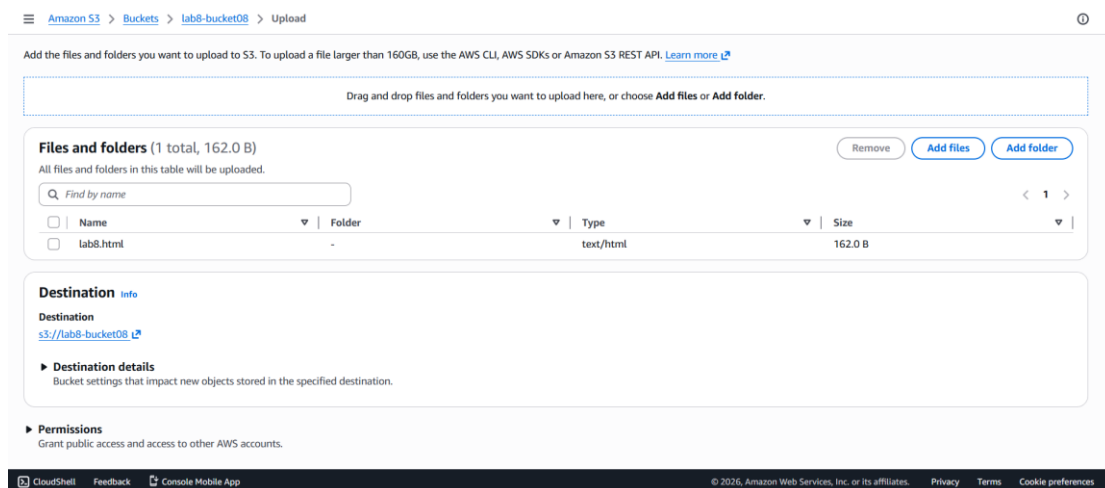

Application Security → Protects apps from **attacks and data theft**

Step 1: Create an Amazon S3 Bucket

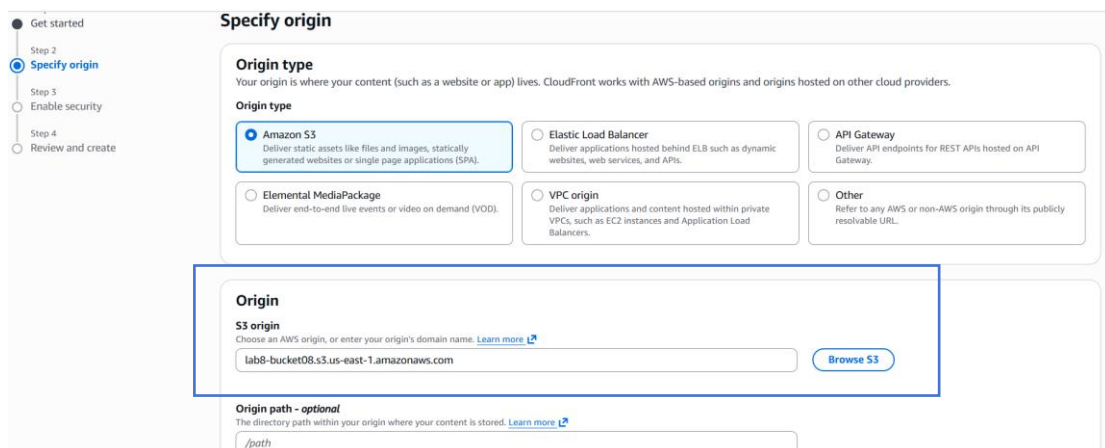

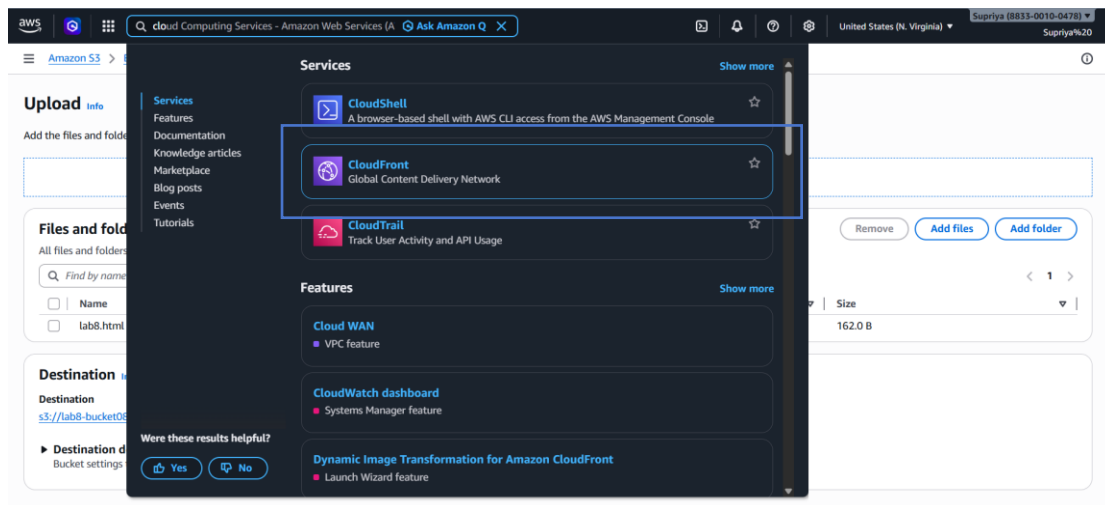

Before That Create HTML File

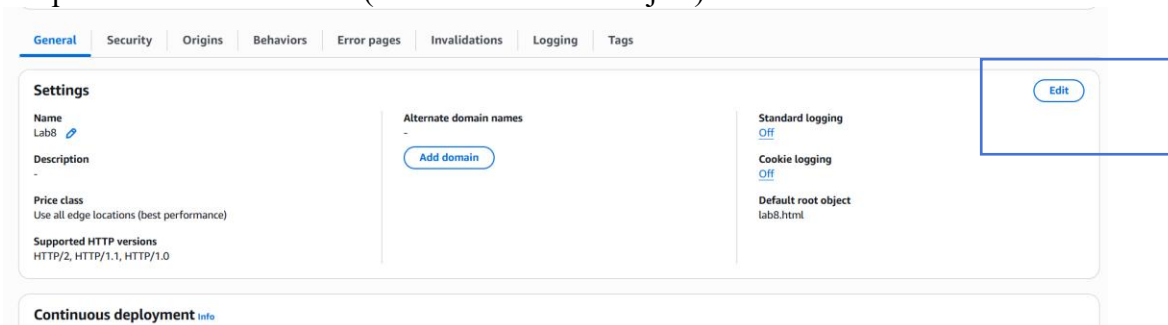

Step2 : Upload HTML File to S3 Bucket

Step 3 : Select CloudFront (Content Delivey Network)

Step 4: Create Distribution (Edit Default Root Object)

CloudFront > Distributions > ELNOFMHNRCSM > Edit settings

Custom SSL certificate - optional

Associate a certificate from AWS Certificate Manager. The certificate must be in the US East (N. Virginia) Region (us-east-1).

Choose certificate

Request certificate

Supported HTTP versions

Add support for additional HTTP versions. HTTP/1.0 and HTTP/1.1 are supported by default

☒ HTTP/2
 ☐ HTTP/3

Default root object - optional

The object (file name) to return when a viewer requests the root URL (/) instead of a specific object.

lab8.html

Description - optional

Connectivity

Price class

Choose the price class associated with the maximum price that you want to pay.

☒ Use all edge locations (best performance)
 ☐ Use only North America and Europe
 ☐ Use North America, Europe, Asia, Middle East, and Africa

Step 5 :Copy the Distribution Domain Name Copied

Supriya (8833-0010-0478)

Supriya%20

Search

[Alt+S] Ask Amazon Q

CloudFront > Distributions > ELNOFMHNRCSM

Successfully updated distribution settings.
